roda<sub>1</sub> rotação:

$$(1) \quad \tau - R_1 F_{a1} = I_1 \alpha_1$$

roda<sub>2</sub> rotação:

$$(2) \quad R_2 F_{a2} = I_2 \alpha_2$$

Carro Completo

$$(3) \quad F_{a1} - F_{a2} = M \cot \alpha$$

$$(4) \quad \alpha = \alpha_1 R_1 = \alpha_2 R_2$$

$$(5) \quad N_2 + N_1 - M \cot g = 0$$

Chassis : Rotação  
+  
rodas dianteiras:

$d_{cm}$ : distância  
entre eixo  
traseiro e  
centro de massa

$d_x$ : distância  
entre eixos

$$\tau + d_x N_2 - (M+M_2)g d_{cm} = 0$$

Para a frente não levantar

$$\tau < (M+M_2)g d_{cm}$$

aceleração máxima sem deslizar

4

(11)

$$F_{a1max} = M_e N_1$$

de eq.(3) e eq.(11):

$$M_e N_1 - F_{a2} = M_{tot} a_{max}$$

usando (2) e (4) para substituir  $F_{a2}$ :

$$M_e N_1 - \frac{I_2}{R_2^2} a_{max} = M_{tot} a_{max}$$

(12)

$$M_e N_1 = \left( M_{tot} + \frac{I_2}{R_2^2} \right) a_{max}$$

das eq. (5) e (6):

$$\rightarrow M + M_2 = M_{tot} - M_1$$

(13)

$$N_1 = M_{tot} g - \frac{d \cos(\theta) (M_{tot} - M_1) g - \tau}{dx}$$
